

ANTI-RAIN FILM

Details:

This anti-rain film is made using high density polyethylene (HDPE), enriched with substances that produce a correct thermal and insulating effect. These conditions, according to the variety of fruit and general climatic conditions, help product ripening, improving it up to 20/30 days earlier compared to uncovered products. **Anti-rain film** is used during critical seasons (months with highest amount of insolation and strong winds), so in labs studied technical solutions that guarantee durability and mechanical traction resistance. This is why **anti-rain film** was reinforced around the edges, by thermally joining a highly-resistant plastic cable in order to install it correctly and to avoid the risk of tearing, even with strong stresses. Our **anti-rain film** is certified and guaranteed.

Dimensions:

- **2,40x200 meters**
- **2,60x200 meters**
- **2,70x200 meters**
